

GUIDE TO AUTOMATED DRY TRIMMING

SAVE TIME, COSTS AND HEADACHES

DRY TRIMMING

Automated cannabis dry trimming is a revolutionary method that uses machines to trim cannabis plants, eliminating the need for manual trimming, saving time and increasing efficiency.

Automated Cannabis Dry Trimming: A Step-by-Step Guide Dry trimming is a crucial process in the post-harvesting phase of cannabis cultivation. It involves carefully manicuring the dried cannabis buds to remove excess leaves and stems. Traditional dry trimming methods are time-consuming and labor-intensive. However, with the advent of automation technology, dry trimming can now be done more efficiently and effectively. In this step-by-step guide, we will walk you through the process of automated cannabis dry trimming. From setting up the equipment to achieving perfectly trimmed buds, we will cover every detail.

READY

The first step in automated cannabis dry trimming is setting up your trimming machine. Start by finding a clean and well-ventilated space to work in. Next, assemble your trimming machine according to the Trimmer Manual.

PREPARE

Prepare Your Dried Cannabis Buds Before you start trimming, it's important to properly prepare your dried cannabis buds. Begin by removing the buds from the branches or stems. This can be done by carefully cutting or twisting the buds until they separate. Take care not to damage the trichomes or delicate structures of the buds during this process. Once the buds are separated, you may want to remove any larger leaves that are visibly protruding from the buds. However, do not remove the smaller sugar leaves surrounding the buds, as they contribute to the overall aroma and flavor of the final product.

LOAD

Load the Trimming Machine Now that your buds are prepared, it's time to load them into the trimming machine. Most automated trimming machines feature a rotating drum or conveyor belt system that gently tumbles the buds while trimming them. Carefully place your prepared buds into the machine's feeding tray or hopper, ensuring that they are evenly distributed. Avoid overloading the machine, as this can result in uneven trimming and potential damage to the buds.

SET UP

Every strain of cannabis is unique, and the desired trim level may vary based on personal preference or the intended use of the buds. To control the correct trim level, there are only 3 settings to control. 1. Blade tension, this should be tight, but not over tight. 2. Speed, normally between 24rpm to 35rpm is recommended. 3. Time, normally 12mins to 15mins is recommended, however this will vary by strain and personal preference.

START

Start the Trimming Process Once you have loaded the buds and adjusted the settings, it's time to start the trimming process. Turn on the trimming machine and watch the buds as they are gently rotated and trimmed. During the trimming process, keep a close eye on the buds to ensure that they are being trimmed evenly. Adjust the settings or reposition the buds if necessary to achieve a more uniform result.

MONITOR

Monitor the Trimming Progress As the trimming process continues, periodically check the buds to monitor the progress. Look for any areas that may require additional trimming or touch-ups. You may need to manually remove excess leaves or stems that were missed by the machine. Carefully inspect the buds for any signs of damage or degradation. Automated trimming machines are designed to minimize damage, but it's still important to be vigilant and address any issues promptly.

COLLECT

Collect and Store the Trimmed Buds Once the trimming process is complete, carefully collect the trimmed buds from the machine. Use a clean container or tray to catch the trimmed buds and prevent any loss or contamination. Inspect the trimmed buds one final time, removing any remaining excess leaves or stems. Ensure that the buds are properly dried and cured before storage to maintain their quality and potency.

CLEAN

Clean and Maintain the Trimming Machine After completing the trimming process, it's essential to clean and maintain your trimming machine. Follow the manufacturer's instructions for proper cleaning and maintenance procedures. This typically involves disassembling the machine, removing any residual plant material, and sanitizing the components. Regular maintenance of your trimming machine is crucial to ensure its longevity and optimal performance. Regularly check for any worn-out or damaged parts that may need replacement.

Follow this step-by-step guide to automate your cannabis dry trimming process and streamline your post-harvest workflow. Remember to always prioritize the quality and integrity of your buds throughout the entire trimming process.

Happy trimming!
